

European Residual Mixes 2013

Results of the calculation of Residual Mixes for purposes of electricity disclosure in Europe for the calendar year 2013

Version 1.0, 15 May 2014

Introduction

Note: For background information regarding the concept of Residual Mix calculations and its application please refer to the website of the RE-DIIS project <http://www.reliable-disclosure.org>, where you can find the final report of Phase I of the project and the RE-DIIS Best Practice Recommendations.

A country's residual mix represents the shares of electricity generation attributes available for disclosure, after the use of explicit tracking systems, such as guarantees of origin, has been accounted for. Due to the international nature of both the electricity markets and tracking systems, the amount of available generation attributes (in MWh) in the domestic residual mix differs from the volume of untracked consumption¹. Thus, the calculation needs to be harmonised for the entire Europe, which is achieved through the European Attribute Mix (EAM), the "equalising reservoir" for generation attributes. After the attribute balancing via EAM (Figure 3), the volume of available generation attributes in each country's residual mix is equal to the untracked consumption of the country. This is an absolute precondition for the shares of different energy sources in the residual mix to be reliably used for disclosure of untracked consumption.

Table 1, Figure 1 and Figure 2 represent the national residual mixes for 2013 as calculated by the RE-DIIS II project for 31 European countries². In Figure 1 and Figure 2, colours indicate different energy sources as elaborated by the legend, and the solid black line in Figure 1 illustrates the share of untracked consumption out of the total electricity consumption. Note that for countries without recorded explicit tracking, untracked consumption equals the total electricity consumption and thus the residual mix is applicable for the disclosure of the entire electricity consumption.³

Energy sources in the residual mixes are divided in three main categories: renewable, nuclear and fossil, of which renewable and fossil are further divided into subcategories (Table 2). Selected subcategories are based on relevance in terms of volume and perceived consumer importance.

Based on the national onsite CO₂ emission factor for fossil fuel, the CO₂ content of the residual mix was also calculated for each country (Table 1 and Figure 4). Note that these figures are destined for electricity disclosure purposes only. This does not imply any recommendation by the RE-DIIS project team of these figures to be used in corporate or product carbon footprint calculation. This is due to unresolved data inconsistencies and open issues regarding carbon footprint methodologies. For the calculation of radioactive waste content in the residual mix (Figure 5) a default factor of 3 mg was used for radioactive waste per kWh of nuclear power generated.

The total supplier mixes (TSMs) are presented in Figure 6 and Figure 7. The total supplier mix represents the total consumption mix of the country, i.e. shares of energy sources in the tracked and untracked part of consumption. Thus,

¹ Untracked consumption = Electricity consumption for which the energy source is not explicitly disclosed through tracking instruments such as Guarantees of Origin.

² Austria, Belgium, Bulgaria, Switzerland, Cyprus, Czech Republic, Germany, Denmark, Estonia, Spain, Finland, France, Great Britain, Greece, Croatia, Hungary, Ireland, Iceland, Italy, Lithuania, Luxembourg, Latvia, Malta, Netherlands, Norway, Poland, Portugal, Romania, Sweden, Slovenia, Slovakia

³ Calculation of the Residual Mix obviously can only take the volumes of explicit tracking systems into account if the respective data is public, respectively being made available to the one who conducts the calculation. This means that explicit tracking systems, for which no statistical data is available to RE-DIIS, cannot be reflected in the residual mix and are therefore likely to lead to double counting.

both available and explicitly tracked attributes are included in the TSM, which equals in physical volume with the country's total electricity consumption.

Figure 8, Figure 9 and Figure 10 present the comparison between the production and residual mix of different countries, and Figure 12 and Figure 13 that of production and total supplier mix (in TWh in Figure 14 and Figure 15). Figure 16 and Figure 17 show the difference between final residual mixes and production mixes of 2011, 2012 and 2013. Finally, Figure 18 and Figure 19 disclose the volumes of EECS and National GO transactions which have been taken into account for the calculation.

Note: Any use of the data presented in this document should include a reference to the RE-DIIS II project and the title and version number of this document.

Disclaimer on data quality:

Because of unavailability of consistent data, the residual mixes were calculated based on all recorded GO transactions during the assumed time period for disclosure of 2013 consumption (1.4.2013 – 31.3.2014), irrespective of the underlying production year of these GOs. Given the current availability of data, this is the best available information. Volumes which have been explicitly tracked without the use of transparent tracking instruments, e.g. by so-called contract based tracking, self-declarations etc., cannot be taken into account at all. RE-DIIS will continue to work with national governments and competent bodies as responsible policy makers as well as with the providers of this data to further improve data quality and consistency in the future.

Residual mixes disclosed in this document are not final and may change due to later data updates, particularly regarding contract-based tracking. Note that through the European Attribute Mix, this might affect also the residual mixes of other countries.

Untracked Consumption = Electricity consumption not explicitly disclosed through tracking instruments such as Guarantees of Origin.

EAM = European Attribute Mix. Used to balance surpluses and deficit in national residual mixes caused by international trading of electricity and guarantees of origin.

Note: CO₂ and radioactive waste figures reported are destined for purposes of electricity disclosure only (rf. page 1).

Data Sources: Information reported by national Competent Bodies; Association of Issuing Bodies (AIB); Entso-e
